1 General Information on The TCG TSS 2.0 Specification Library

1.1 Acronyms

For definitions of the acronyms used in the TSS 2.0 specifications please see the TCG TSS 2.0 Overview and Common Structures Specification [22].

1.2 TCG Software Stack 2.0 (TSS 2.0) Specification Library Structure

At the time of writing, the documents that are part of the specification of the TSS 2.0 are:

- [1] TCG TSS 2.0 Overview and Common Structures Specification
- [2] TCG TSS 2.0 TPM Command Transmission Interface (TCTI) API Specification
- [3] TCG TSS 2.0 Marshaling/Unmarshaling API Specification
- [4] TCG TSS 2.0 System API (SAPI) Specification
- [5] TCG TSS 2.0 Enhanced System API (ESAPI) Specification
- [6] TCG TSS 2.0 Feature API (FAPI) Specification
- [7] TCG TSS 2.0 TAB and Resource Manager Specification

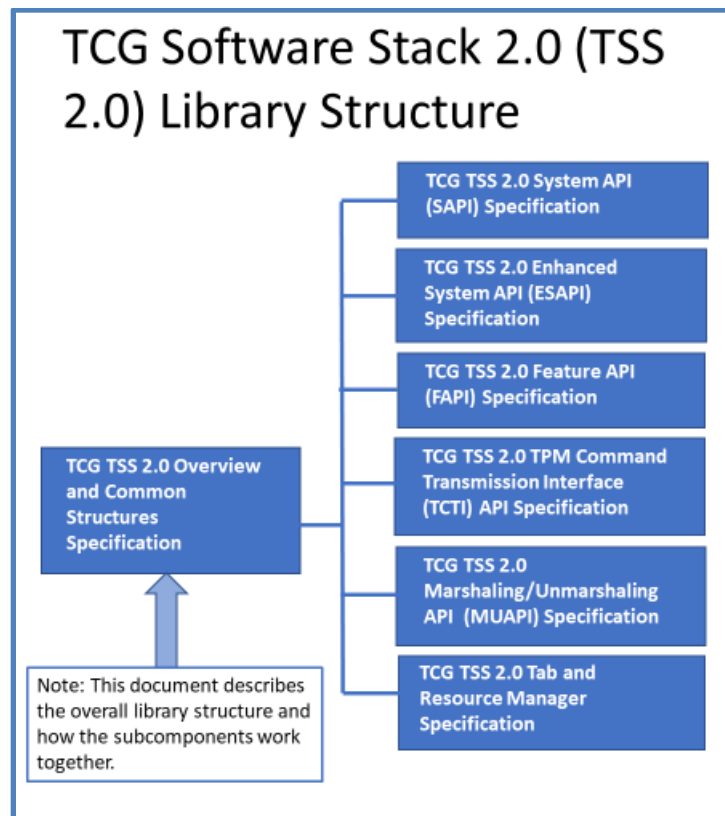

Figure 1: TSS 2.0 Specification Library

All references and acronyms for the TSS 2.0 library are in the TCG TSS 2.0 Overview and Common Structures Specification [22].

2 TCTI Introduction

The TPM command transmission interface (TCTI) handles all the communication to and from the lower layers of the TSS software stack. For instance, different interfaces are required for local hardware TPMs, firmware TPMs, virtual TPMs, remote TPMs, and software TPM simulators.

NOTE: There are two different interfaces to TPMs: the legacy TIS interface and the command/response buffer (CRB).

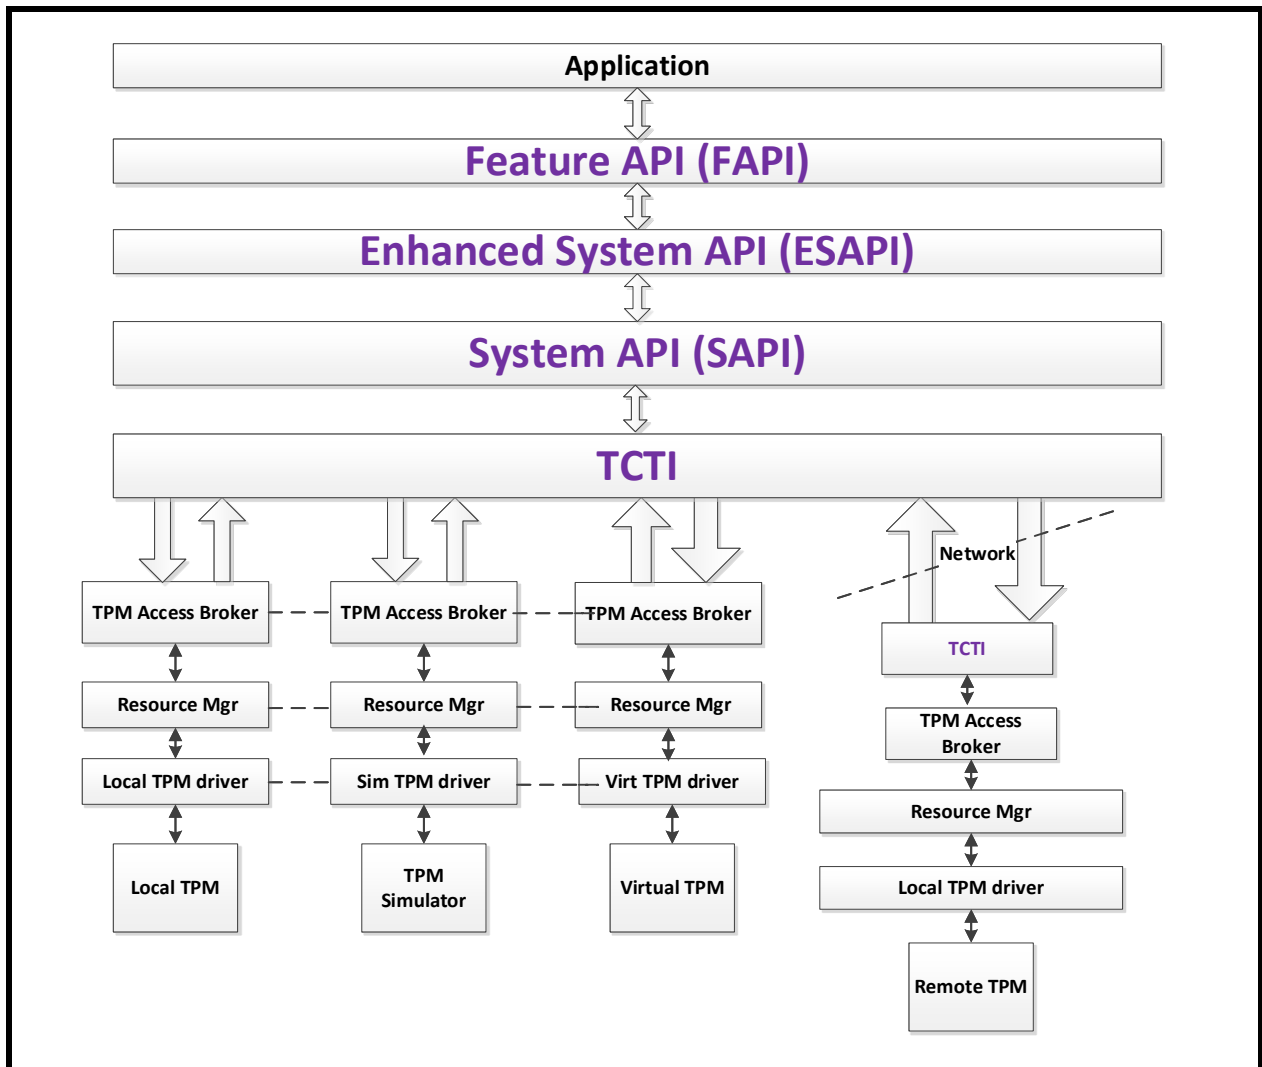

Figure 2: Using TCTI to Connect to Various Target TPMs

2.1 TCTI Target Systems

The TCTI API is designed to be used in a large range of computing devices from highly embedded systems to server OSes.

The TCTI is a low-level interface intended for expert applications. The SAPI uses the TCTI to communicate with the TPM. Use of the TCTI requires an understanding of common device driver interfaces. TCTI provides a generic interface to a wide variety of transport methods that can be used to communicate to the TPM.

3 TPM Command Transmission Interface

The TPM Command Transmission Interface (TCTI) is used to send marshalled commands to and receive marshalled responses from the TPM (or the underlying software stack that ultimately interacts with a TPM). It is designed to handle a wide variety of transmission methods.

3.1 Introduction

3.1.1 Purpose & Goal

The TPM Command Transmission Interface is designed to make it possible to switch modules at run time.

An application or the Feature-API may be configurable with regards to the “TCTI-drivers” they offer to a user. The TCTI is designed specifically for these use cases and provides conventions and helpers to be runtime-loadable friendly while still allowing compile-time linking without namespace clashes.

Initialization of the TCTI interface is accomplished in a driver-specific manner and is out of scope for this specification.

3.2 TCTI data structures

All TCTI data structures are included in the header file, `tss2_tcti.h`. The contents of `tss2_tcti.h` are specified in chapter 4.

3.3 TCTI Context data structures

3.3.1 TCTI Context

The TCTI Context is an opaque pointer when passed in to the SAPI implementation. It is created by the caller, typically using a TCTI implementation. However, the SAPI implementation must extract several fields (typically function callbacks) in order to communicate with the next lower layer.

The SAPI implementation must not write any fields of the TCTI context.

The TCTI context consists of three parts.

- A version area
- A non-opaque area
- An opaque area

The structure definitions look generally like this. They are explained below.

```
typedef struct TSS2_TCTI_OPAQUE_CONTEXT_BLOB TSS2_TCTI_CONTEXT;
```

```
/* superclass to get the version */
```

```
typedef struct {
    uint64_t magic;
    uint32_t version; // 1 for this version
} TSS2_TCTI_CONTEXT_VERSION ;
```

```
/* current version #1 known to this implementation */
```

```

typedef struct {
    uint64_t magic;
    uint32_t version;
    TSS2_RC (*transmit)( TSS2_TCTI_CONTEXT *tctiContext, size_t size,
const uint8_t *command);
    TSS2_RC (*receive) (TSS2_TCTI_CONTEXT *tctiContext, size_t *size,
uint8_t *response, int32_t timeout);
    void (*finalize) (TSS2_TCTI_CONTEXT *tctiContext);
    TSS2_RC (*cancel) (TSS2_TCTI_CONTEXT *tctiContext);
    TSS2_RC (*getPollHandles) (TSS2_TCTI_CONTEXT *tctiContext,
TSS2_TCTI_POLL_HANDLE *handles, size_t *num_handles);
    TSS2_RC (*setLocality) (TSS2_TCTI_CONTEXT *tctiContext, uint8_t locality);
} TSS2_TCTI_CONTEXT_COMMON_V1;

typedef struct {
    TSS2_TCTI_CONTEXT_COMMON_V1    v1;
    TSS2_TCTI_MAKE_STICKY_FCN      makeSticky;
} TSS2_TCTI_CONTEXT_COMMON_V2;

typedef          TSS2_TCTI_CONTEXT_COMMON_V2          TSS2_TCTI_CONTEXT_COMMON_CURRENT;

```

3.3.2 Function Invocation

In order to call any of these functions, an application first needs to check that a given TCTI Context has the correct version number, which is a version greater or equal to the version at the time that the function was added to the common function table. The application then needs to check whether the function is also implemented by the respective driver, that is, whether the function pointer is non-NULL. Only then can the function be safely called. This process can be encapsulated inside a helper macro such as the following example:

```

#define          Tss2_Tcti_Transmit(tctiContext,          size,          command)          \
    ((tctiContext == NULL) ? TSS2_TCTI_RC_BAD_REFERENCE: \
    (((TSS2_TCTI_CONTEXT_VERSION *)tctiContext)->version < 1) ? \
    TSS2_TCTI_RC_WRONG_ABI_VERSION : \
    (((TSS2_TCTI_CONTEXT_V1 *)tctiContext)->transmit == NULL) ? \
    TSS2_TCTI_RC_NOT_IMPLEMENTED: \
    ((TSS2_TCTI_CONTEXT_V1 *)tctiContext)->transmit(tctiContext, size, \
command))

```

A similar pattern can be implemented for all TCTI function pointers.

3.3.3 Version Area

The SAPI implementation extracts the version area by casting the opaque context to a `TSS2_TCTI_CONTEXT` structure. Each context structure must begin with the same members as the `TSS2_TCTI_CONTEXT` structure.

The *magic* value is some unique number, perhaps simply a random number. The SAPI implementation will likely not read it. The value is a sanity check, ensuring that the lower TCTI layer receives a context that it can interpret, typically one it created.

The *version* value denotes the version number of the context structure. This value must monotonically increase from older to newer versions. The first version was 0x1. The current version is 0x2.

The SAPI implementation supports one or more versions of TCTI.

In the simplest case, the SAPI implementation supports one version. This would not necessarily be the latest version, but rather the numerically lowest version that contains all fields that the implementation requires. Using the lowest possible version permits the SAPI implementation to use the largest possible set of TCTI implementations.

In a more complex case, the SAPI implementation supports multiple TCTI versions. This might be useful if a version is deprecated, where a callback has been superseded by an improved function.

3.3.4 Non-opaque Area

The contents of a non-opaque area are defined by the *version*. The TCG defines versions and their contents. Each newer version must contain all fields of the previous version in the same order. Callbacks must have identical parameters and return values. This permits the SAPI implementation to safely cast a TCTI context to any version not greater than the value in the *version* field.

Once the context is cast, structure members can be dereferenced and used. A typical structure member is a function callback provided by the TCTI implementation.

3.3.5 Function Callbacks

The SAPI implementation extracts these callbacks from the non-opaque area of the TCTI context.

3.3.5.1 transmit

```
TSS2_RC (*transmit)(
    TSS2_TCTI_CONTEXT    *tctiContext,
    size_t                size,
    const uint8_t        *command
);
```

This function transmits the command packet of size bytes to next layer below the caller.

Response Codes:

- **TSS2_TCTI_RC_NOT_IMPLEMENTED: if the function isn't implemented**

NOTE: this error code would only be used if future versions of this spec deprecated or removed the transmit call.

- **TSS2_TCTI_RC_IO_ERROR: underlying IO failed**
- **TSS2_TCTI_RC_BAD_CONTEXT: bad version and/or magic fields in the TCTI-context**

- **TSS2_TCTI_RC_BAD_SEQUENCE:** if transmit was called more than once without a call to receive in between
- **TSS2_TCTI_RC_BAD_REFERENCE:** if tctiContext or command is NULL
- **TSS2_TCTI_RC_BAD_VALUE:** if a bad value for any parameter is detected

NOTE: Some possible examples of bad values are: size out of range, size not at least 10 bytes, or size doesn't match commandSize.

3.3.5.2 receive

```
TSS2_RC (*receive)(
    TSS2_TCTI_CONTEXT    *tctiContext,
    size_t               *size,
    uint8_t              *response,
    int32_t              timeout
);
```

This function receives a response packet from the layer below the caller.

If the parameter response is NULL and the size of the TPM response is known, the required size is written to the size parameter and TSS2_RC_SUCCESS is returned.

On input, *size* is the maximum allocated byte size of *response*. On a successful return, *size* is the actual used bytes of *response*. If *size* is insufficient for the TPM response the required size is returned in *size* with TSS2_TCTI_RC_INSUFFICIENT_BUFFER error.

NOTE: in some cases, depending on the communication interface, this will require the TCTI layer to keep track of the data read from the interface during the unsuccessful call to receive. A subsequent call to receive using the same TCTI context and a larger response buffer and size could be used to get the response data and clear the interface so that subsequent commands can be sent.

If *timeout* is TSS2_TCTI_TIMEOUT_BLOCK, the command is synchronous and blocks until a response is received.

If *timeout* is TSS2_TCTI_TIMEOUT_NONE, the command returns immediately. *size* and *response* are updated only on a successful return.

If *timeout* is positive, the command returns after a maximum of *timeout* msec. *size* and *response* are updated only on a successful return.

receive always returns either the entire TPM response or a return code indicating that the response is not yet completely available. A TCTI implementation that might receive partial responses can use the response buffer to assemble the partial responses.

There is one exception to the above: *receive* may return a return code indicating that the response buffer is too small to hold the TPM response. In that case, the caller must call receive again with a larger buffer.

Response Codes:

- **TSS2_TCTI_RC_NOT_IMPLEMENTED:** if the function isn't implemented
- **NOTE:** this error code would only be used if future versions of this spec deprecated or removed the receive call.
- **TSS2_TCTI_RC_BAD_CONTEXT:** bad version and/or magic fields in the TCTI-context

- **TSS2_TCTI_RC_TRY_AGAIN:** if a timeout occurred before the complete response was received.
- **TSS2_TCTI_RC_INSUFFICIENT_BUFFER:** if the response buffer is too small for the TPM response. In this case, the returned size indicates the size of the buffer that is needed for the response.
- **TSS2_TCTI_RC_IO_ERROR:** Underlying IO failed.
- **TSS2_TCTI_RC_BAD_REFERENCE:** if `tctiContext` or `size` is `NULL`
- **TSS2_TCTI_RC_BAD_VALUE:** if `timeout` is negative but not `-1` (`TSS2_TCTI_TIMEOUT_BLOCK`) or `response` is `NULL`.
- **TSS2_TCTI_RC_BAD_SEQUENCE:** if `receive` called again after first successful `receive` or if `transmit` not called first

3.3.5.3 finalize

```
void (*finalize) (
    TSS2_TCTI_CONTEXT          *tctiContext
);
```

This function performs any actions required when a TCTI connection is terminated and invalidates the TCTI Context. The TCTI Context cannot be used for subsequent operations after this call. This function should be called whenever a TCTI Context is not needed anymore. Afterwards the TCTI Context memory can be freed.

3.3.5.4 cancel

```
TSS2_RC (*cancel) (
    TSS2_TCTI_CONTEXT          *tctiContext
);
```

This function causes the TCTI layer to cancel the command: in some TCTI implementations this may include sending the TPM cancel command. This command can only be called between `transmit` and `receive` calls.

NOTE: After calling `cancel`, `receive` still needs to be called.

Response Codes:

- **TSS2_TCTI_RC_NOT_IMPLEMENTED:** if the function isn't implemented
- **TSS2_TCTI_RC_IO_ERROR:** if connection to the TPM fails.
- **TSS2_TCTI_RC_BAD_SEQUENCE:** if not called between `transmit` and `receive`.
- **TSS2_TCTI_RC_BAD_REFERENCE:** if `tctiContext` is `NULL`
- **TSS2_TCTI_RC_BAD_CONTEXT:** bad version and/or magic fields in the TCTI-context

3.3.5.5 getPollHandles

```
TSS2_RC (*getPollHandles) (
```

```

TSS2_TCTI_CONTEXT      *tctiContext,
TSS2_TCTI_POLL_HANDLE  *handles,
size_t                  *num_handles
);

```

NOTE: This function was added to support event-loop driven programming. If polling or select aren't needed, this function isn't necessary. Understanding this function requires a detailed understanding of poll and select calls.

This function retrieves the handles that can be used for polling or select. This function returns a set of handles that can be used to poll for incoming responses from the underlying software stack or TPM. The type for these handles is platform specific and defined separately in the declaration of TSS2_TCTI_POLL_HANDLE. In order to query the number of handles that a TCTI module needs to have monitored, the application may pass NULL for handles; in this case, it returns the number of handles. In pseudo-code this could be:

```

*getPollHandles (&tctiContext, NULL,&num);
TSS2_TCTI_POLL_HANDLES handles[num];
*getPollHandles (&tctiContext, &handles[0], &num);
poll(&handles[0], num, -1); // Platform specific syscall

```

Response Codes:

- **TSS2_TCTI_RC_NOT_IMPLEMENTED:** if the function isn't implemented
- **TSS2_TCTI_RC_BAD_REFERENCE:** if tctiContext, handles, or num_handles is NULL
- **TSS2_TCTI_RC_INSUFFICIENT_BUFFER:** if num_handles is too small
- **TSS2_TCTI_RC_BAD_CONTEXT:** bad version and/or magic fields in the TCTI-context

3.3.5.6 setLocality

```

TSS2_RC (*setLocality) (
    TSS2_TCTI_CONTEXT      *tctiContext,
    uint8_t                  locality
);

```

This function sets the locality for the TPM.

The locality cannot be changed between transmit and receive

Response Codes:

- **TSS2_TCTI_RC_NOT_IMPLEMENTED:** if the function isn't implemented
- **TSS2_TCTI_RC_BAD_REFERENCE:** if tctiContext is NULL
- **TSS2_TCTI_RC_IO_ERROR:** if command fails due to an IO error
- **TSS2_TCTI_RC_BAD_SEQUENCE:** if locality is changed between transmit and receive calls
- **TSS2_TCTI_BAD_VALUE:** if TCTI can't support the locality, e.g. the locality doesn't even exist.

- **TSS2_TCTI_RC_NOT_PERMITTED:** if the change in locality is not permitted, e.g. the locality is supported by the TPM, but the lower layer doesn't allow changing the locality.
- **TSS2_TCTI_NOT_SUPPORTED:** if the lower layer doesn't support changing localities at all.
- **TSS2_TCTI_RC_BAD_CONTEXT:** bad version and/or magic fields in the TCTI-context

3.3.5.7 makeSticky

```
TSS2_RC (*makeSticky) (
    TSS2_TCTI_CONTEXT    *tctiContext,
    TPM_HANDLE           *handle,
    uint8_t              sticky
);
```

If *sticky* is 1, this function allows an application to request the underlying resource manager to make sure that a certain session, sequence or object is loaded in TPM memory. Making a handle sticky means that it will stay loaded in TPM memory, meaning the RM won't unload it. This allows another process (typically a kernel) to use the object without concern about whether it's loaded in TPM memory.

If *sticky* is 0, and *makeSticky* is called with the physical handle returned when it was made sticky, the object is made unsticky. Making a handle unsticky means that the RM is free to manage it as it desires.

If a session, sequence, or object is made sticky, it can only be made unsticky by the same *tctiContext*.

NOTE: If the finalize call to TCTI context is called, the associated connection breaks, or the application process exits, all sticky sessions, sequences, and objects will be flushed from the TPM.

This function is optional for TCTI and will only be implemented, i.e. non-NULL and not returning TSS2_TCTI_RC_NOT_IMPLEMENTED, if the TCTI layer is communicating with a resource manager.

Due to the nature of this function - being able to do a denial of service attack on the TPM - it should be restricted for usage by privileged applications and/or users only. Details on how to identify those or what privileged means are platform and stack specific and thereby out of scope for this specification.

The handle parameter is an input and output parameter. If *sticky* is 1, on input, *handle* is a virtual handle which is going to be made sticky; on output, *handle* is the real handle. If *sticky* is 0, on input, *handle* is a real handle which is going to be made unsticky; on output, *handle* is the virtual handle.

NOTE: In order to use "trusted key ring" from the Linux kernel, an application must be able to pass a real handle for a loaded object to the kernel. It can't pass a virtual handle because the kernel is bypassing the RM which means that no virtual to physical handle translation is possible.

When a session, sequence, or object is sticky, its previous virtual handle can't be used.

NOTE: for sessions this is required to avoid application/kernel conflicts because session state changes whenever it's used. For sequences and objects, this isn't strictly required, but it was specified this way for the sake of consistency.

Response Codes:

- **TSS2_TCTI_RC_NOT_IMPLEMENTED:** if the function isn't implemented
- **TSS2_TCTI_RC_BAD_REFERENCE:** if *tctiContext* or *handle* is NULL
- **TSS2_TCTI_RC_IO_ERROR:** if command fails due to an IO error

- `TSS2_TCTI_RC_BAD_SEQUENCE`: if function is called between transmit and receive calls
- `TSS2_TCTI_RC_BAD_CONTEXT`: bad version and/or magic fields in the TCTI-context
- `TSS2_TCTI_RC_BAD_HANDLE`: if the handle does not exist or is not owned by the TCTI context.
- `TSS2_TCTI_RC_BAD_VALUE`: if *sticky* is not 0 or 1.

3.4 Compatibility

This design anticipates that the non-opaque area might change over time, with new functions added and existing functions deprecated or even deleted (set to NULL). The section lists a few such use cases.

The SAPI implementation might receive an old but still completely useful context. Assuming it has a structure definition for this version (which is why it was recommended that the implementation use the oldest suitable structure), it casts to that version and continues.

3.4.1 Old and Not Useful Version

The SAPI implementation can receive an old TCTI context version that it cannot use because it requires a callback not available in the old version. The implementation detects the down level version (by detecting that it's less than required version) and returns an error.

The TCTI implementation must be updated to support the new requirements.

3.4.2 New but Useful Version

If the SAPI implementation receives a newer version than the one compiled in, it can cast the TCTI context to its down level version and use existing structure members. The cast is safe because new members are added at the end of the structure and existing members are never removed.

The implementation cannot access new members, but it was not coded to use them anyway.

3.4.3 New and Not Useful Version

The implementation might receive a newer context version where structure members that it requires have been superseded by newer members. For example, the TCTI implementation might provide a new callback with a different parameter list.

The TCTI implementation flags this situation by setting an older, now unimplemented function callback to NULL. After the cast, the SAPI implementation detects the NULL. It cannot continue because a function it requires is no longer available.

The SAPI implementation must be updated to use the new callback.

3.4.4 New Version with Deprecated Functions

If the SAPI implementation receives a context version with both deprecated and recommended function callbacks, it can handle it one of two ways.

If it was compiled to only handle a down level context, it will cast and use only the deprecated callbacks.

If it was compiled to handle several context versions, it can cast to a more recent version and use the recommended callbacks.

3.5 Opaque Area

The SAPI implementation cannot access the opaque area of the TCTI context. The TCTI implementation can add any implementation specific fields as needed to the opaque area.

The TCTI is expected to cast the context to its implementation specific context type based on the version number. Since the TCTI both creates and consumes the context, no incompatibility is expected.

The TCTI implementation may also validate that the magic value is as expected. This sanity check ensures that the pointer passed in is indeed a TCTI context known to the TCTI implementation.

4 TCTI Header File

tss2_tcti.h

4.1 TCTI Prelude

```
#ifndef TSS2_TCTI_H
#define TSS2_TCTI_H

#include <stdint.h>
#include <stddef.h>
#include "tss2_common.h"
#include "tss2_tpm2_types.h"

#ifndef TSS2_API_VERSION_1_2_1_108
#error Version mismatch among TSS2 header files.
#endif
```

4.2 TCTI Data Structures

TSS2_TCTI_POLL_HANDLE: The TCTI supports an asynchronous mode of operation for processing TPM commands. After transmission of a command, the application can request to be notified when the response is available for reception. The TSS2_TCTI_POLL_HANDLE type is used as a data type for the handles that are used when querying for this notice. Since these handles are highly platform specific, they will change depending on the type of platform. For some platforms the handles are defined in the following; further handle types will be defined in future revisions of this specification. Note that not all TCTI-drivers have support for this function.

```
/*
 * "Public" TCTI definitions and operations.
 */

/* Define OS-specific TSS2_TCTI_POLL_HANDLE */
#ifdef WIN32
#include <windows.h>
typedef HANDLE TSS2_TCTI_POLL_HANDLE;
#elif defined(_POSIX_C_SOURCE)
#include <poll.h>
typedef struct pollfd TSS2_TCTI_POLL_HANDLE;
```

```

#else
typedef void TSS2_TCTI_POLL_HANDLE;
#ifndef TSS2_TCTI_SUPPRESS_POLL_WARNINGS
#pragma message "Info: Platform not supported for TCTI_POLL_HANDLES"
#endif /* TSS2_TCTI_SUPPRESS_POLL_WARNINGS */
#endif /* OS selection */

/* Constants used to control timeout behavior */
#define TSS2_TCTI_TIMEOUT_BLOCK -1
#define TSS2_TCTI_TIMEOUT_NONE 0

/* TSS2_TCTI_CONTEXT is a data structure opaque to the caller. */
typedef struct TSS2_TCTI_OPAQUE_CONTEXT_BLOB TSS2_TCTI_CONTEXT;

```

4.3 TCTI Macros

The following macros simplify some basic TCTI tasks.

```

/* Macros to simplify invocation of functions from the common TCTI structure */
#define Tss2_Tcti_Transmit(tctiContext, size, command) \
    ((tctiContext == NULL) ? TSS2_TCTI_RC_BAD_CONTEXT: \
    (TSS2_TCTI_VERSION(tctiContext) < 1) ? \
    TSS2_TCTI_RC_ABI_MISMATCH: \
    (TSS2_TCTI_TRANSMIT(tctiContext) == NULL) ? \
    TSS2_TCTI_RC_NOT_IMPLEMENTED: \
    TSS2_TCTI_TRANSMIT(tctiContext)(tctiContext, size, command))
#define Tss2_Tcti_Receive(tctiContext, size, response, timeout) \
